Process would proceed in 2 steps, in which the first step would be an epoxidation of cyclohexene to form cyclohexanediol (CHD), using  $O_2$  or  $H_2O_2$ . The second step would be the aerobic oxidative cleavage of CHD to adipic acid. The aerobic epoxidation of cyclohexene was achieved using Au supported on graphite or graphene. May 1th, 2024.
